**FIG. 1**

1. The first step is to identify the problem or goal. This involves understanding the current situation and what needs to be achieved.

2. Next, it's important to gather information. This can include research, consulting with experts, and collecting data relevant to the problem.

3. Once you have gathered information, you should analyze it. This means looking for patterns, identifying key factors, and understanding the underlying causes of the problem.

4. After analysis, you should develop a plan. This involves deciding on the best course of action to take, considering potential risks and benefits, and setting clear objectives.

5. The next step is to implement the plan. This means putting the plan into action, allocating resources, and monitoring progress.

6. Finally, you should evaluate the results. This involves comparing the actual outcomes with the expected results, identifying any gaps, and making adjustments as needed.
